

## ABSTRACT

Disclosed are an organic semiconductor material having high charge mobility characteristics and an organic semiconductor element. The organic semiconductor material has rodlike low-molecular liquid crystallinity, comprising: a skeleton structure comprising L 6  $\pi$  electron aromatic rings, M 10  $\pi$  electron aromatic rings, and N 14  $\pi$  electron aromatic rings, wherein L, M, and N are each an integer of 0 (zero) to 4 and  $L + M + N = 1$  to 4; and a terminal structure attached to both ends of the skeleton structure. The terminal structure can develop liquid crystallinity. The phase angle  $\theta$  of impedance of the organic semiconductor material is  $-80^\circ \leq \theta \leq -90^\circ$  as determined in the measurement of impedance in a frequency  $f$  range of  $100 \text{ Hz} \leq f \leq 1 \text{ MHz}$  in such a state that the organic semiconductor material in an isotropic phase state is held between a pair of opposed substrates with an interelectrode spacing of  $9 \mu\text{m}$ .
